BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

IMAGES ARE BEST AVAILABLE COPY.

As rescanning documents will not correct images, please do not report the images to the Image Problem Mailbox.

Title: Perfect score: US-09-037-657-1

Scoring table: Sequence: BLOSUM62 1 WSXWS 5

Searched: 188963 seqs, 23686106 residues

Database : A_Geneseq_36:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

(GENE-) GENETICS INST IN
                                                                                                                                                                                                      The sequence was deduced from DNA from a clone isolated from a cDNA library prepd. from uninduced murine erythroleukemia cells. It is a type I transmembrane protein with binding affinity for EPO. The gene and recombinant EPO receptor produced on expression of the DNA are used to develop reagents and systems to control and study erythropolesis. It is believed that the EPO receptor is dysfunctional in individuals with Diamond Blackfan anaemia, and
                                                                                                                                                  may be hyperactive in polycythemia vera. See also R06512 (human EPO receptor). Sequence 507 AA;
                                                                                                                                                                                                                                                                                                                                                                           Erythropoletin receptor and gene - used for developing reagents and systems to control and study erythropolesis.

                    Example: Fig 12: 24pp; German.

Example: Fig 12: 24pp; German.

The sequence is that of fusion protein GM-CSFRFc comprising the extracellular domain of granulocyte macrophage-colony stimulating factor (GM-CSF) fused via a hinge region to the Fc part of the heavy chain of human IgGl. It may be used as part of a cell free receptor binding test which can be used for the identification of agonists, antibodies, biological activity of soluble cellular antipodies, biological activity of soluble cellular antipodies.
                                                                                                                                                                                                                         03-JUN-1992;

The sequence was deduced from DNA obtd. from a clone isolated is commercially available human geenomic cDNA library in phage a commercially available human geenomic cDNA library in phage lambda Fix (Stratagene). The sequence encodes a type I transmembrane protein with binding affinity for EPO. The gene and recombinant EPO receptor produced on expression of the DNA are used to develop reagents and systems to control and study erythropolesis. It is believed that the EPO receptor is dysfunctional in individuals with Diamond Blackfan anaemia, and me be hyperactive in polycythemia vera.

One positive recombinant was isolated from the Hep G2 library, which was later used as a probe to rescreen the library. Five additional cDNAs were identified, and by combining two of the Six cDNAs, a PRL receptor cDNA of 2.5 kb was constructed, contg. a single ORF of 1866 bp. Similar partial length cDNA were isolated from the T47-D library.

Several regions of sequence identity between the human growth hormone and PRL receptors can be found, both in the extracellular and cytoplasmic domains.

The sequence is an important genetic engineering tool which may be used for the screening of growth hormone variants, for the development of the trace of the screening of growth hormone wallars.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    of test kits to measure PRL receptor levels in human breast and prostate cancer biopsies, for the mesasurement of bioactive forms of prolactin, and for the development of drugs to induce stimulation or inhibition of

The hPRLbp gene fragment is transcribed under the control of the alkaline phosphatase promoter and secreted into the host (E.coli) periplasm under the direction of the stII signal sequence. A stop codon and MiuI restriction site were introduced after the threonine 211 codon which inmediately precedes the transmembrane domain of the receptor. The plasmid was used as a template for site-directed mutagenesis to modify the metal-chelating centre of the protein. See e.g. R24273
               MPLV env-vmpl fusion protein.
                                                                                                                                                                                                                                                                                                                                                                 Plasmid phPRLbp(1-211) (see R22228) coding for truncated, soluble prolactin binding protein was mutagenised such that the His codon at position 188 was substituted by an Ala codon. The hPRLbp variant has altered binding affinity for hGH.
                                                                                                                                                                                                                                                                                                                                                                                                                         lactogenic and somatogenic response Claim 41; Page 56; 74pp; English. Polypeptides similar to v-mlp protein or mruv treatment of myeloproliferative diseases.

Claim 1, Page 28; 75pp; French.

This polypeptide is encoded by clone MPLV107, isolate genomic bank prepared from clones of Mus dunni cells a unique copy of the MPLV provirus. The bank was screa unique copy of the MPLV provirus.
                                                                                                                                                                                                             05-NOV-1992
                                                                                                                        30-APR-1992.

                                                                                                                                                                                                                                                                                                                                                                                        Polypeptides similar to v-mlp protein of MPLV - f treatment of myeloproliferative diseases Claim 8; Fig 28; 75pp; French.

The rearranged env MPLV gene has an open reading acids and deduced mol.wt. of 31kD. The env-vmpl f comprises the N-terminal 64 amino acids from F-ML the signal peptide, 36 amino acids from the centre F-MLTV env gene and 184 amno acids specific to MF See R23970, 024674-7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                30-APR-1992.

The protein is involved in the ligand-fixing or signal-transmitting function of haematopoietic growth factor receptors; is recognised by antibodies to the protein R23970; when produced from the MPLV genome it can induce the protein R23970; when produced from the MPLV genome it can induce the protein R23970; when produced from the MPLV genome it can induce the matter of the mat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 promote proliferation of haematopoietic cells in differentiation of haematopoietic cells. PT treatment of myeloproliferative diseases

PS Claim 4; Page 31; 75pp; French.

CC This polypeptide is an example of a fragment related to the MPLY

CC env protein having the amino acid sequence assigned GENESEQ

CC accession number R23970. The protein is involved in the

CC ligand-fixing or signal-transmitting function of haematopoletic

CC growth factor receptors; is recognised by antibodies to the

CC protein R23970; when produced from the MPLY genome it can induce/

CC promote proliferation of haematopoletic cells and/or is involved

CC see also 024674-7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                    Disclosure; Fig 2; 24pp; English.

Mouse erythroleukaemia (MEL) cells were used to construct a cDNA library. The cDNA was used to transfect COS-1 cells and these were screened for radioiodinated erythropoletin (EPO) binding to isolate cDNA encoding the EPO receptor. The cDNA may be used to isolate the EPO receptor from other sources to study, treat or diagnose disorders in which the EPO receptor is dysfunctional. The EPO receptor may also be used to raise antibodied or for treating hypersensitivity to EPO or who have elevated levels of EPO. The por
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         modified_site

Mouse soluble EPO receptor protein fragment.

Murine; soluble; erythropoletin; EPO; receptor protein; sEPO-R;

antigen; diagnostic agent; blochemical reagent.

Mus musculus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        develop prods. for study, treatment or diagnosis of disorders in which receptor is dysfunctional Disclosure; Fig 9; 24pp; English.

Mouse erythroleukaemia (MEL) cells were used to construct a cDNA ilbrary. The cDNA was used to transfect COS-1 cells and these were screened for radioiodinated erythropoietin (EPO) binding to isolate cDNA encoding the EPO receptor. This cDNA was used as a probe to screen a human genomic cDNA library to obtain DNA encoding the human EPO receptor. The cDNA may be used to study, treat or diagnose disorders in which the EPO receptor is disprinctional. The EPO disorders in which the EPO receptor is disprinctional. The EPO

Soluble erythropoletin receptor protein - and DNA coding for SEDO-R, useful as diagnostic reagent Disclosure; Page 5-6; 9pp; Japanese. This sequence represents a fragment of the murine soluble erythropoletin (EPO) receptor protein (SEPO-R). This protein is able to bind to EPO and has antigenicity as an EPO receptor. The molecular wieght of the full length protein is pref 33 or 29 kD. The protein is useful as a drug, as a diagnostic agent and a blochemical reagen sequence 265 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Key

C5-B BINDS C9 AND ACTS AS A CATALYST IN THE FOLYMERIZATION OF C9.
SUBUNIT: C8 IS COMPOSED OF THREE CHAINS: ALPHA, BETA AND GAMMA
THE ALPHA AND GAMMA CHAINS ARE DISULFIDE BONDED.
SIMILARITY: TO COMPLEMENT FACTORS C6, C7, C9, AND TO PERFORIN.
